Mikhail Razakov

.NET Backend / Platform Engineer · State & Reliability

razakov.mikhail@outlook.com
t.me/Micodiy
github.com/Misha1302

I build .NET systems for payments, subscriptions, and synchronization where retries and partial failures must not corrupt state. VpnMediator reconciles payment and access state; botay! replays offline operations idempotently; the LMS verifies provider payments before ledger updates.

Payment correctness
A webhook is not treated as ground truth: provider payment state is re-fetched and checked for id/status/environment/metadata/amount/currency

Recovery ownership
Durable inbox/outbox, idempotency, reconciliation, restart recovery, leases, and manual review for conflicting evidence

Release safety
Versioned releases, coordinated backup, atomic switching, health gates, and rollback to the previous release

PROFESSIONAL EXPERIENCE & CLIENT WORK

July — August 2026

MCST — Compiler Engineering Intern

- Implemented a LICM pass for LLVM 22 in C++; hoisting conditions check loop structure, memory access, side effects, and speculative safety.
- Built a Python harness comparing program behavior before/after optimization and checking transform/no-transform cases.

2025 — confirmed

Client development — Diploma.school

- Implemented jQuery dropdown components, responsive mobile/desktop navigation, and UI regression fixes; the work is confirmed no later than January 2025.

PROJECTS

VpnMediator

Verifiable state transitions, backup/restore, health gates, and rollback-aware deployment; the public case study excludes secrets and user data.

botay! / student-execution-os

Built offline-first browser/Android operations with durable client IDs and atomic server replay records; conflicting lifecycle changes remain explicit.

Exactly-once replay at the operation boundary and signed Android 0.8.3 release checks; external user count is not asserted.

CompilationLabLMS

The architecture separates user workflows from financial invariants and supports safe migration and rollback.

SKILLS

.NET Backend
C#/.NET, ASP.NET Core, REST/OpenAPI, webhooks, background services, provider integrations

State & Data
PostgreSQL, SQLite, transactions, explicit state machines, idempotency keys, inbox/outbox, leases

Reliability
provider re-verification, reconciliation, retry ownership, restart recovery, audit/manual review, backup/restore

Operations / Platform
Linux, Docker Compose, nginx, systemd, health gates, versioned releases, atomic switching, rollback

EDUCATION

HSE University — Software Engineering, 2026–2030

RECOGNITION

Organizer correspondence: only 5.0/5.0 score and only solution passing all 104/104 tests among 49 submissions.
