github.com/Misha1302

I build backend workflows that stay consistent through retries and partial failure: payment evidence and access reconciliation in VpnMediator, offline operation replay in botay!, and provider-verified ledger updates in an LMS.

Payment correctness

A webhook is not treated as ground truth: provider payment state is re-fetched and checked for id/status/environment/metadata/amount/currency

Recovery ownership

Durable inbox/outbox, idempotency, reconciliation, restart recovery, leases, and manual review for conflicting evidence

Release safety

Versioned releases, coordinated backup, atomic switching, health gates, and rollback to the previous release

EXPERIENCE

2026 — present — **CompilationLabLMS — payment/backend architecture**

- Made PaymentOrder the owner of allowed state transitions, retry scheduling, and status-check leases; the webhook flow re-fetches payment state from the provider before emitting an internal event
- Validate payment id/status/environment/metadata/amount/currency and keep malformed or unverifiable provider events separate from confirmed state

2026 — present — **VpnMediator — state/recovery backend**

- Designed a durable payment inbox/outbox, idempotent reconciliation, and a manual-review path for conflicting provider evidence; restart recovery is covered by dedicated tests
- Built a versioned release path with coordinated backup, atomic switching, readiness/liveness gates, and restoration of the previous release after failed startup

2025 — confirmed — **Client development — Diploma.school**

- Implemented jQuery dropdown components, responsive mobile/desktop navigation, and UI regression fixes; the work is confirmed no later than January 2025.

PROJECTS

VpnMediator

Verifiable state transitions, backup/restore, health gates, and rollback-aware deployment; the public case study excludes secrets and user data.

botay! / student-execution-os

Built offline-first browser/Android operations with durable client IDs and atomic server replay records; conflicting lifecycle changes remain explicit.

Exactly-once replay at the operation boundary and signed Android 0.8.3 release checks; external user count is not asserted.

CompilationLabLMS

The architecture separates user workflows from financial invariants and supports safe migration and rollback.

SKILLS

NET Backend

C#/.NET, ASP.NET Core, REST/OpenAPI, webhooks, background services, provider integrations

State & Data

PostgreSQL, SQLite, transactions, explicit state machines, idempotency keys, inbox/outbox, leases

Reliability

provider re-verification, reconciliation, retry ownership, restart recovery, audit/manual review, backup/restore

Operations / Platform

Linux, Docker Compose, nginx, systemd, health gates, versioned releases, atomic switching, rollback

EDUCATION

HSE University — Software Engineering, 2026–2030

RECOGNITION

Selected as one of the winners with UniversalToolchain / Wist2.

Moscow / remote
