

I design and implement compiler/runtime and backend systems where correctness depends on explicit ownership, state, and lifecycle boundaries. UniversalToolchain resolves composition into one immutable LanguagePlan before execution; VpnMediator separates payment/access state from reconciliation and recovery; the x86-64 backend checks register-allocation decisions with an independent verifier and differential execution.

Architecture ownership

UniversalToolchain exposes one public LanguageCompiler that resolves composition into an immutable LanguagePlan; runtime materializes the already selected graph.

State & recovery

VpnMediator uses explicit payment/access states, idempotency, reconciliation, migrations, backup/restore, health gates, and rollback.

Correctness boundaries

The x86-64 backend checks allocation with an independent assignment verifier and compares native execution against a reference interpreter oracle.

EXPERIENCE

- 2026 — present

ISP RAS — Static Analysis Engineer

 - Contribute to SharpChecker, ISP RAS's C#.NET static-analysis platform.
 - Current work includes symbolic-computation tasks in C#.NET program analysis.
- July — August 2026

MCST — Compiler Engineering Intern

 - Implemented a LICM pass for LLVM 22 in C++; hoisting conditions check loop structure, memory access, side effects, and speculative safety.
 - Built a Python harness comparing program behavior before/after optimization and checking transform/no-transform cases.

PROJECTS

- UniversalToolchain

Current exact test manifest: 1,324/1,324. In a frozen-corpus verifier experiment, B2 detected 32/32 primary and 10/10 challenge operators with 0/100 false positives on valid controls; four post-freeze holdouts were checked separately.
- VpnMediator

A production service with controlled state transitions, backup/restore, health gates, and safe rollback; the public case study excludes secrets and user data.
- x86-64 Compiler Backend & Register Allocation

A reference interpreter and differential execution check generated-code semantics; the allocator assignment contract is verified independently.

SKILLS

- Architecture

ownership/module boundaries, typed contracts, immutable planning, extensibility boundaries, explicit state machines, lifecycle/recovery, architecture verification
- Compiler / Runtime Platforms

.NET, LanguageCompiler/LanguagePlan, dependency/conflict resolution, provider selection, deterministic pass ordering, typed backend routes
- State & Reliability

idempotency, reconciliation, migrations, backup/restore, health gates, rollback, failure containment
- Verification

regression tests, exact manifests, independent verifiers, interpreter/backend parity, differential execution

EDUCATION

HSE University — Software Engineering, 2026–2030

RECOGNITION

Accepted talk on UniversalToolchain's architecture; LangDev'26 takes place October 8–9, 2026 in Málaga.
